

Lessons Earned: Chillers

This Water Chillers chapter focuses on solving performance problems in HVAC construction while providing a “How To” approach to avoid problems in the first place. The chapter is a compilation of decades of experiences from dozens of individuals and firms that represents all aspects of the business of designing and installing systems and figuring out why sometimes they don’t work as expected. This chapter includes illustrations, drawings and photographs. It will help your business if you buy it, read it, and apply it. Problems with water chillers and ancillary systems are covered and a logical thought process designed to achieve project objectives is provided that enables the solution of each problem. These topics are not included in design manuals. You need this chapter if you can’t answer the following: Is chiller peak load kW/ ton irrelevant? What are the peak load hours? What is IPLV? When are air-cooled chillers a better choice than water cooled? What happens when Plants of different buildings are connected? What determines a Plant’s chilled water delta T? Can chillers be located in the same room as boilers? Can cooling tower and condenser pumps performance adversely impact chillers? What is needed to prove a Plant is not performing? If you can use this, you will spend less than \$0.20 per page to avoid \$2000.00 or much, much more of headaches!
