

Science and Nonbelief

Scientists have raised questions about religious belief since the earliest development of scientific thought. Over the centuries, as science has become ever more sophisticated and answered many of the questions previously in the domain of religion, more and more people have developed a skeptical point of view regarding religion. Today, many scientists are nonbelievers with a secular, science-based perspective. In this wide-ranging overview, physicist and acclaimed science writer Taner Edis examines the relationship between today's sciences and religious nonbelief. Beginning with a brief history of science and philosophical doubt, Edis goes on to describe those theories in contemporary science that challenge spiritual views by favoring a naturalistic conception of the world. He provides a very readable, nontechnical introduction to the leading scientific ideas that impinge upon religious belief in the areas of modern physics and cosmology, evolutionary biology, and cognitive and brain science. He also shows how science supplies naturalistic explanations for allegedly miraculous and paranormal phenomena and explains widespread belief in the supernatural. Finally, he addresses the political context of debates over science and nonbelief as well as questions about morality. Complete with an historical chronology, an extensive annotated bibliography, and selections from primary sources, *Science and Nonbelief* is an indispensable and accessible reference work on the subject.
