

Innovation Lessons From China -- Journal Article

Foreign businesspeople complain that China doesn't play fair. But anybody involved in international business should treat China not only as a place to sell but also as a place to learn. Despite China's long and established demand for high-technology products, many leading global companies have become increasingly wary about operating in the Chinese market. They see unfair competitive practices, discriminatory regulation and intellectual property theft "all ostensibly condoned by the government" as part and parcel of the Chinese experience.¹ Foreign businesspeople today routinely complain that in exchange for market access, they are required to transfer technology to favored Chinese competitors. And once such entities have the technology, they "in collusion with the government" will endeavor to seize market share not just in China but also in other markets. We don't deny that some of these claims are valid. After all, the Chinese government openly acknowledges its desire to establish companies that are market leaders and to do so, at least in part, through technology transfer. However, we see a different side of China, one that requires foreign companies to remain actively engaged. Our research describes unique forms of China-based technology innovation, mastery of which is becoming increasingly indispensable for any company aiming to succeed in the global market. (See "About the Research.") Anybody involved

in international business needs to treat China not just as a place to sell, but also as a place to learn. In our view, companies need to lean in rather than pull back.
